Large population-based cohort studies consistently show an inverse association between markers of systemic inflammation and physical activity or fitness status, and data from several small-scale intervention studies support that exercise training diminishes inflammation.

Effect of exercise training on chronic inflammation

When the body's immune response is too pronounced or persistent, autoimmune diseases, such as rheumatism, can develop. Commonly scientists believe the body's immune response cannot be controlled, but a new study suggests otherwise. Radboud University researchers say meditation, breathing exercises, routine exposure to cold (such as an ice bath), and other simple methods might help people activate their autonomic nervous system while simultaneously restraining their immune system.
