Bicycle wheels are typically over 50cm (20 inches) in diameter, which is taller than most car wheels. The taller the wheels, the more they multiply your speed when you turn them at the axle. That's why racing bicycles have the tallest wheels (typically about 70cm or 27.5 inches in diameter).

During a race like the Tour de France, riders may ride with varying tire pressure (psi) amounts based on the stage of the ride and the weather conditions. In this sports science project, students explore how tire pressure relates to the way a bike rides.

Science of Cycling: How to be an elite cyclist

Drafting is an important technique in road racing. Exploratorium Senior Scientist Paul Doherty explained, "The bicyclist, as he moves through the air, produces a turbulent wake behind himself. It makes vortices. The vortices actually make a low pressure area behind the bicyclist and an area of wind that moves along with the bicyclist.

The development of the chain drive helped make the bicycle that we know today possible. The chain drive eliminated the need to have the cyclist directly above the wheel. Instead the cyclist could be positioned between the two wheels for better balance.

With the advent of gears, the cyclist could also pedal more efficiently.

Science of Cycling: History of Drives & Gears | Exploratorium

When racing cyclists aim to reach high speeds, they focus not only on greater power, which has its human limitations, but also on greater aerodynamic efficiency. Aerodynamic drag consists of two forces: air pressure drag and direct friction (also known as surface friction or skin friction).

Science of Cycling: Aerodynamics & Wind Resistance ...

Drafting or slipstreaming is an aerodynamic technique where two vehicles or other moving objects are caused to align in a close group, reducing the overall effect of drag due to exploiting the lead object's slipstream. Especially when high speeds are involved, as in motor racing and cycling, drafting can

In a road bicycle race, the peloton (from French, originally meaning 'platoon') is the main group or pack of riders. Riders in a group save energy by riding close (drafting or slipstreaming) to (particularly behind) other riders.
